

These notes are for use together with the Colley Model.

13. Involuntary loss of urine associated with urgency.

URGENCY URINARY INCONTINENCE (UUI)

If the responses have been in the sand-coloured boxes and the patient does not complain of any voiding difficulties (see 10), and on bladder scan there is no significant residual urine (see 6 and 12), then the most likely diagnosis is that of urgency urinary incontinence.
